

Uncovering the Secrets of Food Delivery Success

When I first started using food delivery services, I thought they were just a convenient way to get a meal after a long day. Little did I know, there's a lot of data behind why people choose certain services and how successful they are. This curiosity led me to explore the world of food delivery campaigns and customer spending, resulting in some surprising insights that I'm excited to share.

Why THIS Project?

I love food delivery—you could say I'm a bit of a frequent flyer in that realm! My motivation came from wanting to understand not just how these services work, but what makes them thrive. I wanted to figure out which customers were spending the most and what campaigns were successful. This project felt special because I was combining my interest in food with data analysis, turning my everyday experiences into something meaningful.

What Readers Will Gain

In this article, you'll learn about the spending habits of food delivery customers, which age groups spend the most, and how effective various marketing campaigns are. I'll share some surprising findings and the reasons behind them, along with visuals to help illustrate my points.

Key Takeaways:

- The age groups of 36-50 and 51-65 are the biggest spenders on food delivery.

- Campaign 6 had the highest sign-up rate but did not influence how much people spent.
- Higher income is linked to increased spending on food delivery, but most people spend between \$4-\$626.

Dataset Details

The data I used came from iFood, featuring 2022 entries across 39 categories. This dataset was ideal because it provided a broad view of customer behavior, enabling me to analyze spending patterns and campaign effectiveness.

Analysis Process

I began by cleaning the data to remove any inconsistencies. Then, I visualized the data using Excel, highlighting trends in spending by age and income. I also looked closely at the performance of various campaigns. One of the biggest surprises was seeing that even with a high sign-up rate for campaign 6, it had no real impact on the spending behavior of participants compared to those who didn't sign up. I thought this would show a difference, but it didn't. It made me wonder about the possible reasons—perhaps the campaign didn't resonate as much as intended?

Visuals and Insights

- **Age Spending Graph:** This visual shows that individuals aged 36-50 and 51-65 spent the most. I believe this is due to them being busier with work and family obligations, leading to a greater reliance on delivery services.

- **Campaign Performance Chart:** Here, campaign 6 is clearly the standout performer with 311 sign-ups. However, it was puzzling to find that sign-ups didn't translate into higher spending.

- **Income vs. Spending:** This graph illustrates that as income rises, spending on food delivery also increases. It's a clear indication that financial capability plays a significant role in customer behavior.

- **Overall Spending Trends:** Most users spend between \$4-\$626, which suggests that while delivery services are popular, many customers are budget-conscious.

Main Takeaways:

This project has highlighted important insights about the factors influencing food delivery usage. The demographic analysis revealed that middle-aged customers are the key group for these services. It's interesting how even a successful campaign like campaign 6 didn't lead to increased spending; this could suggest that sign-ups are more about convenience than driving higher purchases. Understanding these trends can help food delivery services tailor their offerings and marketing to better meet the needs of their customers.

Conclusion and Personal Reflections

Working on this project was enlightening. I faced challenges, particularly when trying to explain why certain campaigns didn't yield the expected results. However, these obstacles pushed me to think critically about customer behavior and marketing strategies. I've come away with a deeper understanding of how demographics and income levels can shape consumer choices, which will certainly inform my future work in data analysis.
